### EVERYTHING YOU WANTED TO KNOW ABOUT QR CODES, BUT WERE AFRAID TO ASK

Quick Response Codes (QR codes) are a type of two-dimensional, matrix-style barcode. Using a camera and an app installed on a smartphone, iPhone or tablet, QR codes link to a web page designed to provide more information and show pictures or a video. Most smartphones or tablets contain pre-loaded QR code reader apps, and there are free ones available through most device's app stores (examples: Android Market, Apple App Store, etc.).

## SECO Manufacturing – 40 Years of Innovation – 72 Years of Inspiration

SECO Manufacturing Co., today enjoys a worldwide reputation for being on the cutting edge of manufacturing accessories for surveying, construction, utilities and other industries using GPS/GNSS technology. It started as a father-son retail enterprise, more than 70 years ago.

### Early beginnings: 1944-1977

The SECO story began in 1944 when Ivan Ogden, a civil engineer for the State of California Division of Highways, developed polio. Prior to his illness, he worked in the San Francisco Bay Area, including a stint as a surveyor on the Bay Bridge. After his illness, Ivan was confined to a wheelchair and unable to return to traditional work, so he began repairing survey transits in his home.

Soon, thereafter, Ivan and his wife, Viola, opened a retail surveying business called Ogden Surveying Equipment Company (OSECO) on Elvas Avenue in Sacramento. It offered instruments, equipment, supplies and services for land surveyors. Following his dad into the business, Paul Ogden opened his first retail store, Surveying Equipment Company (SECO), in Redding, CA in 1965. Over the next 12 years the company opened retail branches in Medford and Bend, Oregon as well as Boise, Idaho.

### Manufacturing and Innovation: 1977-2017

In 1977, Paul Ogden established a new corporation, SECO Manufacturing Company, Inc., to focus on manufacturing rather than retail.

This came about through the invention of a new survey technology: the electronic distance measuring (EDM) instrument, which quickly replaced the traditional method of using a steel measuring tape. A survey that once took days or weeks with conventional equipment would now take seconds with the electronic mechanisms. The Ogden retail business sold this new instrument, which was housed in a box-like case that mounted on the telescope of the survey transit (theodolite). The mount was awkward and damaging to the instrument, but there was nothing else available.

Paul started experimenting with adapters and a yoke that would allow the surveyor to mount the distance meter to the standards (sides) of the instrument, thus freeing the telescope to move freely. The production of yoke adapters, as they were then called, would lead the Ogdens into the manufacturing industry.

In 1978, shortly after incorporation as SECO Manufacturing, Paul rented a small exhibit space at a national surveyors trade show and displayed several of his aluminum adapters. By then there were scores of competing EDM instruments on the market and each one had a different contour and configuration where the mount attached. SECO offered adapters for any instrument. The response allowed SECO to drop its retail business and concentrate on manufacturing products for the survey industry, starting with the yoke adapters.

Many things have changed since 1977. The electronic distance measuring box has been replaced with the "total station" which integrates the distance device with the theodolite. This created a need for numerous other accessories such as poles that would hold the glass prism for the distance meter, carrying cases, tripods, etc. The pioneering yoke adapter was officially discontinued in 1995.

The company has continued its tradition of innovation. SECO product managers are known for coming up with solutions for any kind of field requirement for survey, construction, mining and energy industries. It's also become a world-wide supplier of these products, with dealers in almost every continent.

SECO, with corporate headquarters based in Redding, CA, controls all facets of its manufacturing business. The company is vertically integrated, managing the entire process in-house, using its multiple manufacturing facilities. With sites in North America and

Europe, SECO controls the process from design to the manufacturing of goods. The multiple sites also assist in the distribution and service for the products.

In 2013, SECO acquired GeoDesy, a company based in Hungary that is well-known for supplying high-end tribrachs to the survey and construction industries.

Precision manufacturing, quality focus, and skilled workmanship provide consistency to always meet and exceed customers' expectations. SECO's continued goal is to be the best accessories supplier for surveying and construction markets. This ongoing mission will ensure that investing in SECO brand products will remain the smartest investment for productivity and longevity in the field.

# PRISM basics

### Prism Offsets

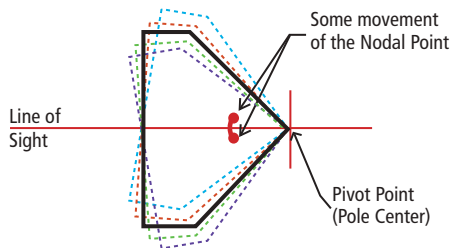

- ▶ Corner cube prisms (or retroreflectors) used with electronic distance measuring (EDM) instruments have an offset due to the fact that the transmitted light beam from the EDM takes longer to enter and exit the prism. This longer time translates to a longer distance measured. This distance is corrected by using an 'offset' and/ or positioning the prism in relationship to the plumb line of the prism holder. The offset is determined by multiplying the height of the prism by the refractive index of the glass used. Common offsets are 0, -17.5 mm, -30 mm, -34 mm, and -40 mm.

### Nodal Offsets

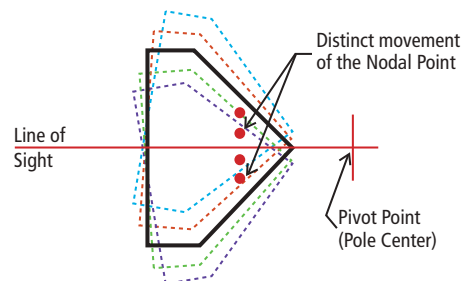

- ▶ A nodal offset is defined by the relationship of the prism holder and prism that places the optical center of the prism on the plumb line of the holder. This offset is the most advantageous at close range work when the apex or center of the prism is used as a pointing target for vertical and horizontal angle measurement. Every prism has a nodal offset. Prisms and holders that are not in the nodal position however, can cause angular errors when using the prism apex as a target if it is not perfectly pointed toward the measuring instrument.
- ▶ To reduce pointing errors, several SECO prism assemblies are designed with a nodal point alignment at -17.5 (for 25 mm prisms) or -40 mm offset (for 62 mm prisms). See illustration at right.
- ▶ Commonly, the best reading of the beam is achieved when the prism face is perpendicular to the incoming beam for a parallel return. Unfortunately, ideal alignment is not always achieved in the field.
- ▶ To compensate for pointing errors, nodal point alignment minimizes the error associated with misalignments (two illustrations below).

at -17.5 or -40 mm Offset

Non-Aligned at -30 mm Offset

Non-Aligned at 0 mm Offset

### Prism Range

- ▶ Corner cube prisms redirect the measuring beam back to the EDM for signal processing. There are two main factors for good range measurement: prism diameter and beam deviation. If the beam deviation is not accurate enough, the returned beam will miss the EDM entirely. This occurs mainly near the maximum range of the EDM (check with your manufacturer). SECO standard prisms are <5 seconds. Higher accuracy prisms are also available.

### Prism Holder Accuracy

- ▶ Prism accuracy is determined by the physical location of the prism in its canister and then to its holder. SECO prism accuracy is 1 mm or less.
- ▶ SECO uses a ZYGO GPI-XP/D interferometer to test and confirm the beam deviation of prisms to ensure that they meet specifications. Certificates of compliance are available upon request. Come see us for more details.
